# Config Generate

1. Config Generate

This generate config functions to set the filters that are generated in each module.

2. Add Config Generate

To add config generate, we can fill in the prefix name, prefix header and footer prefix with the initial word "param" then connected with the name of the field that will be the fiter and at the end of the filling add .txt
Example : {param-FieldName}.txt

For the delimeter itself is the separator that will be used.
