# Undo Marge

      The Undo Marge menu functions to separate several data with the same CRN as the original data, so that the data will have its own CRN. In the image below there are two views of the datagrid. The first data grid view is the GC data view, while the second datagrid view is the original data. To perform Undo Marge, you can select any of the data in the GC and the original data will appear according to the same CRN as the GC's CRN. Next select the data to be separated from the CRN then click the arrow symbol for Undo Marge.

After doing the Undo merge, a success alert will appear as below:
